FOUR QUESTIONS ON SOCIAL NETWORKS---PARTIAL ANSWERS

How social networks are created?

Gallos et al PRX (2012)

How to identify influential spreaders?

Kitsak et al Nature Phys. (2010)

How opinions are formed?

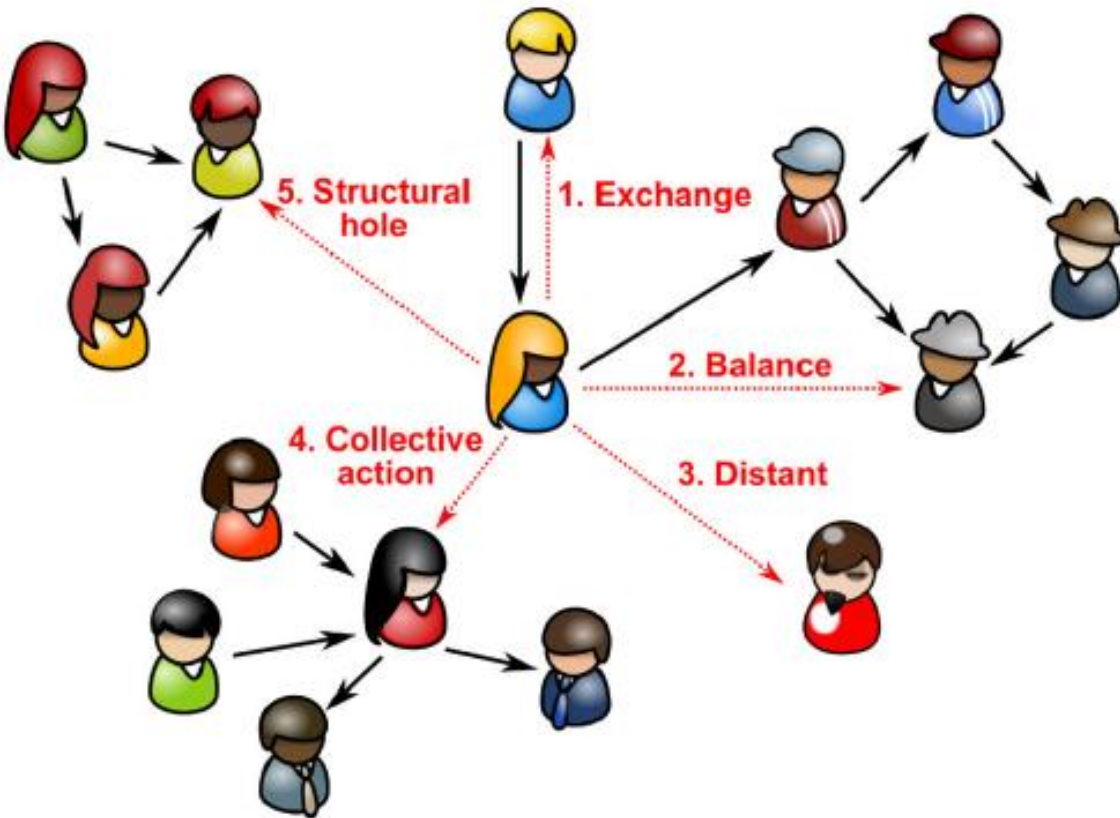

Shao et al, PRL (2009)

Qian Li et al J. Stat. Phys (2013)

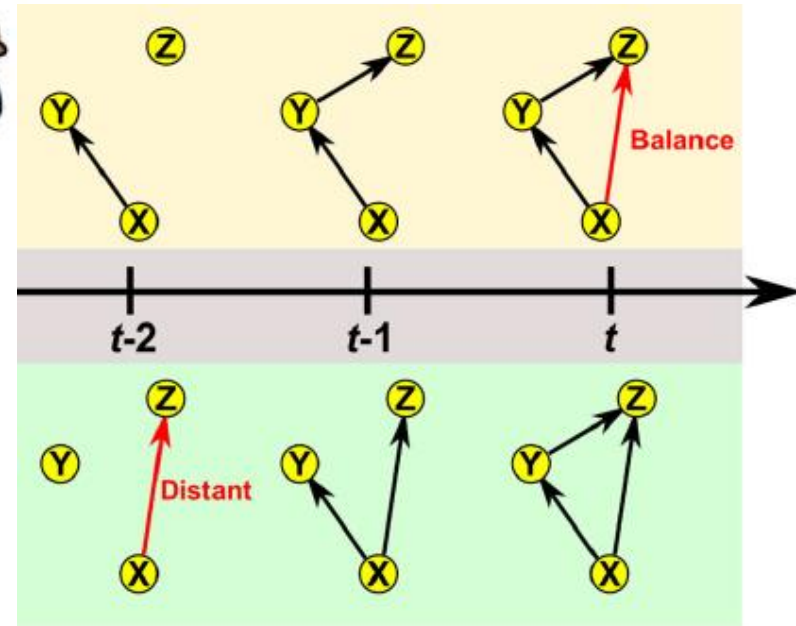

How extreme opinions occur?

Makse et al preprint (2013)

How People Interact in Online Networks?

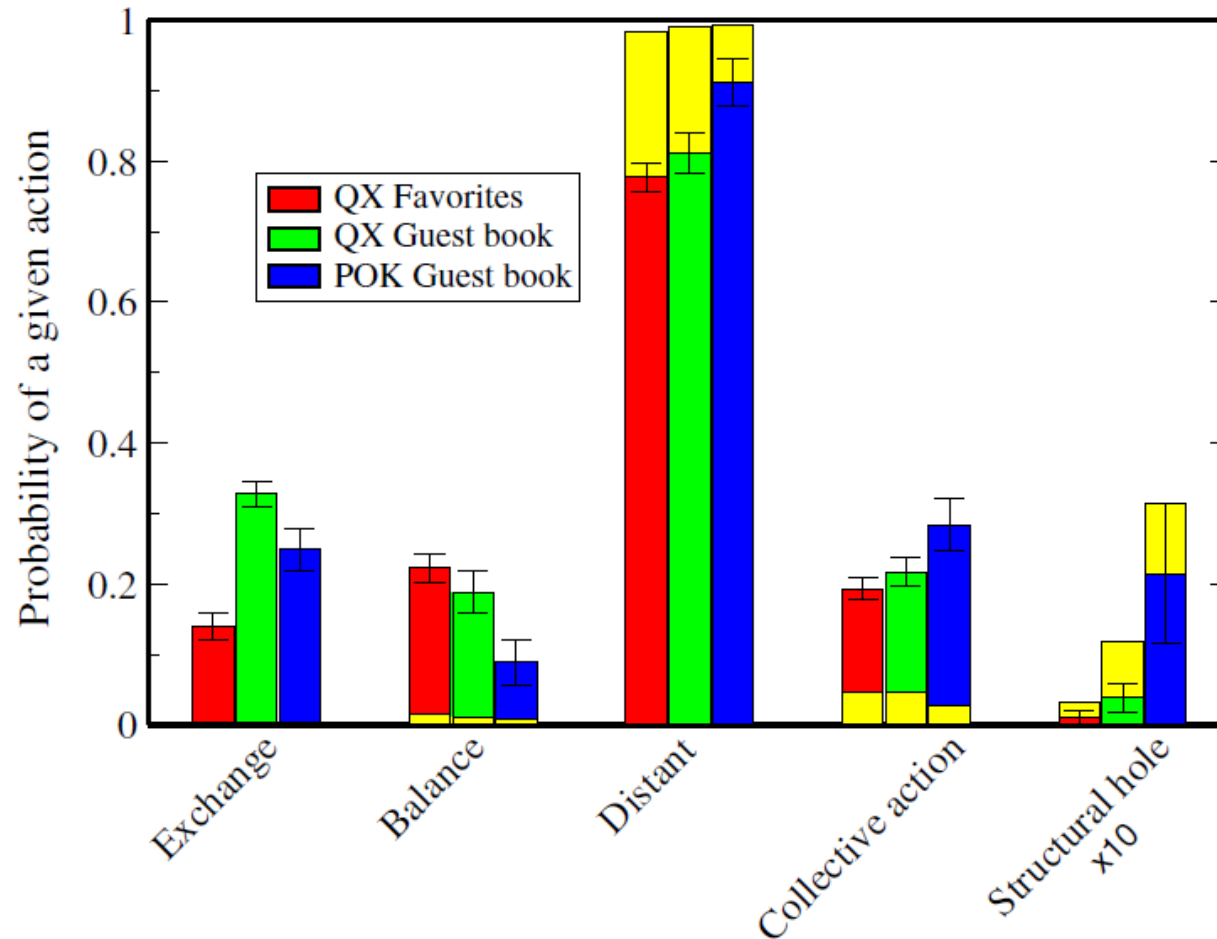

Following dynamics

P. R. Monge and N. S. Contractor, Theories of Communication Networks (Oxford University Press, New York, 2003).

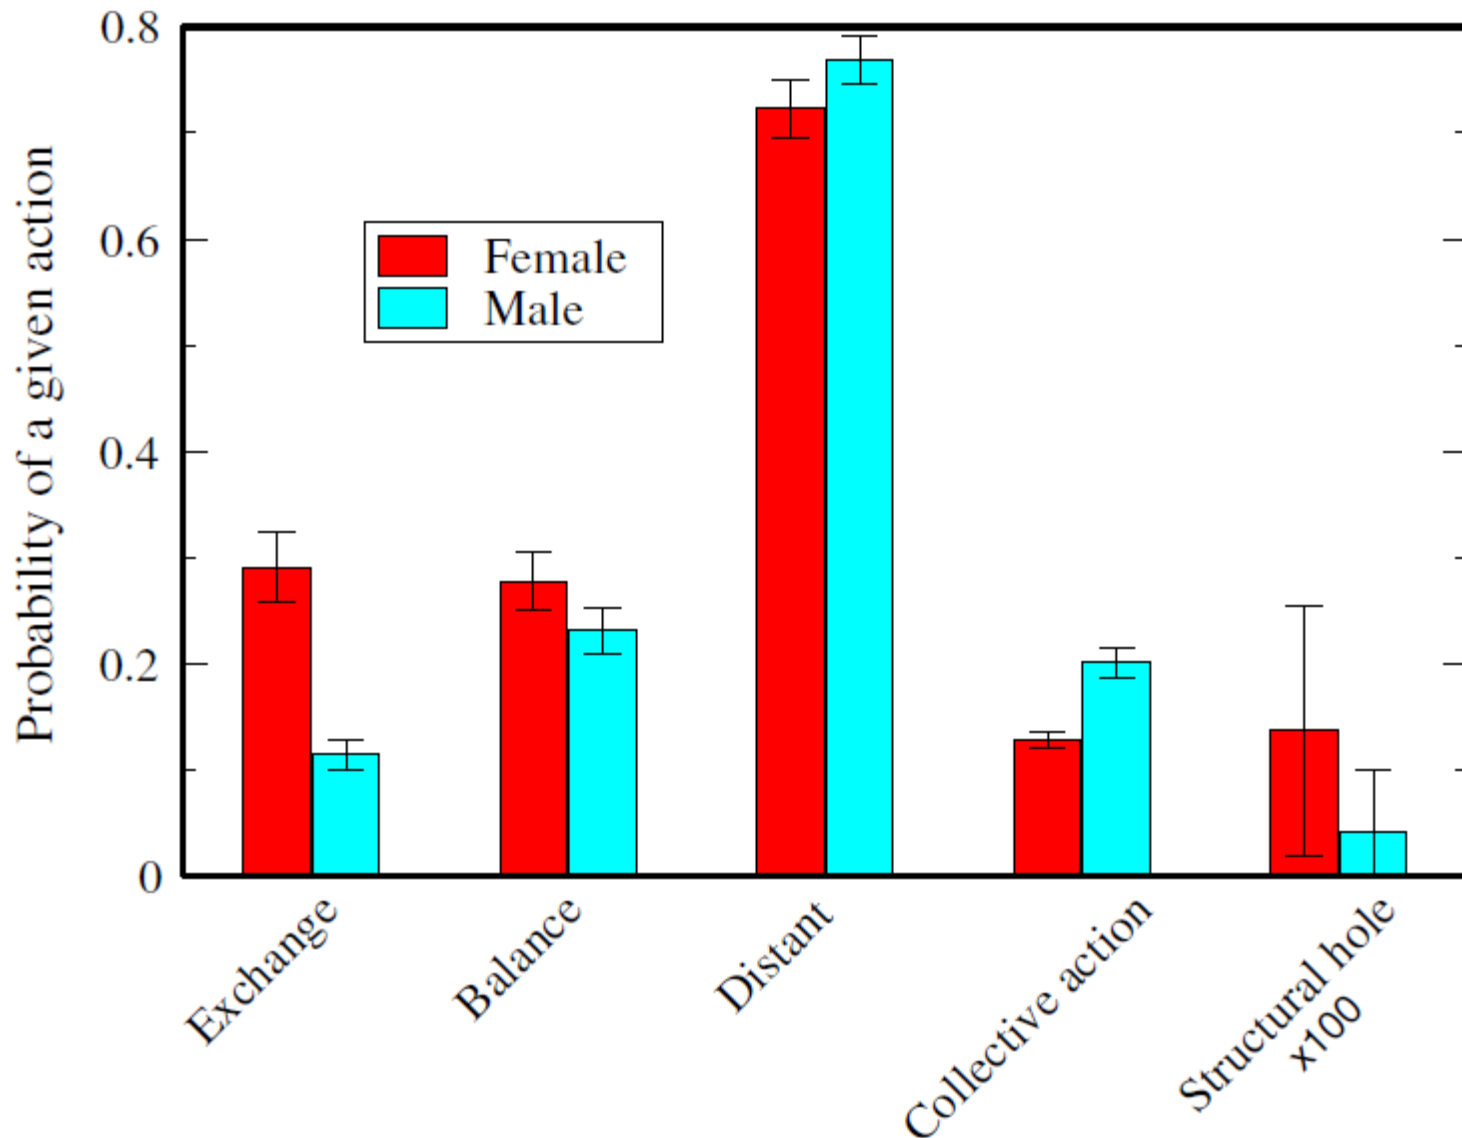

L. Gallos, D. Rybski, F. Liljeros, S. Havlin, H. Makse, PRX, 2, 031014 (2012)

How People Interact in Online Networks?

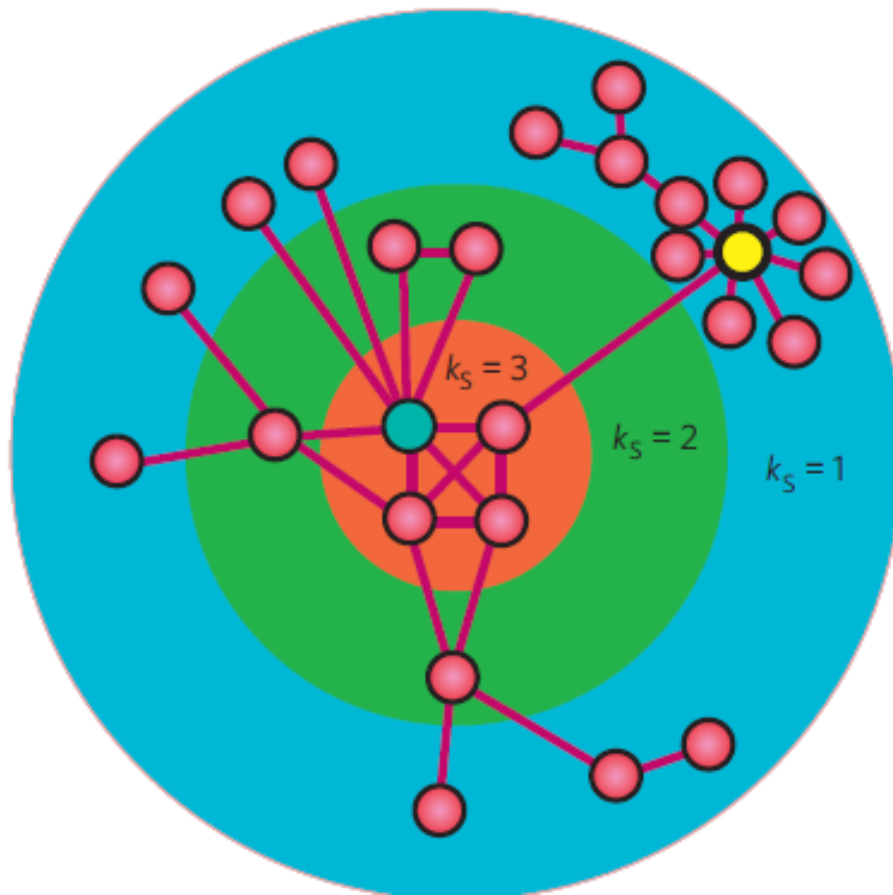

L. Gallos, D. Rybski, F. Liljeros, S. Havlin, H. Makse, PRX, 2, 031014 (2012)

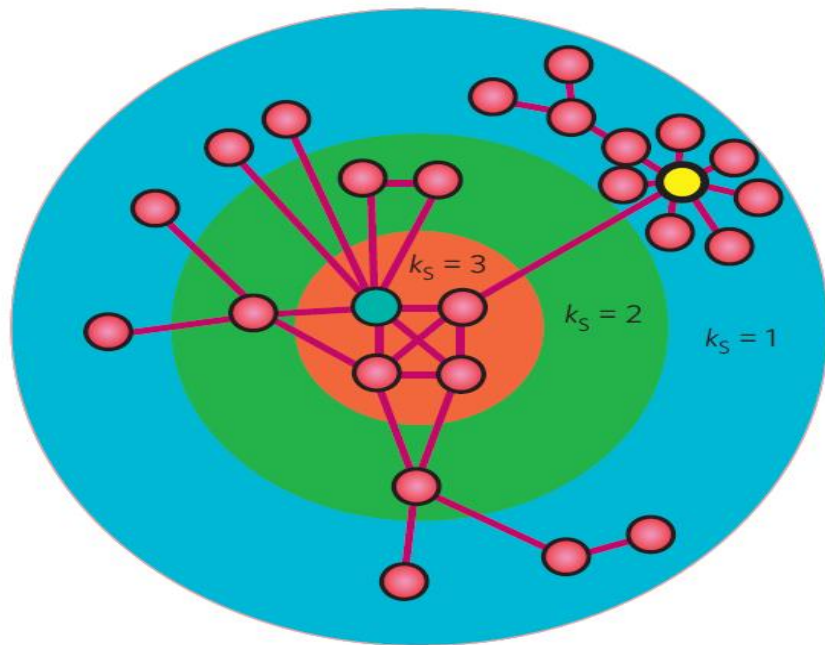

How People Interact in Online Networks?

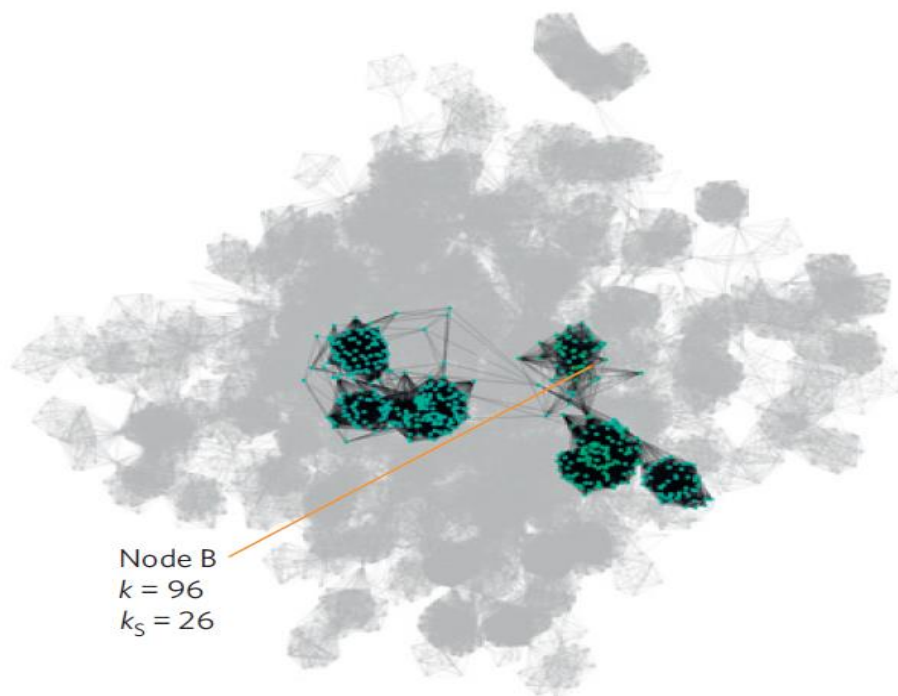

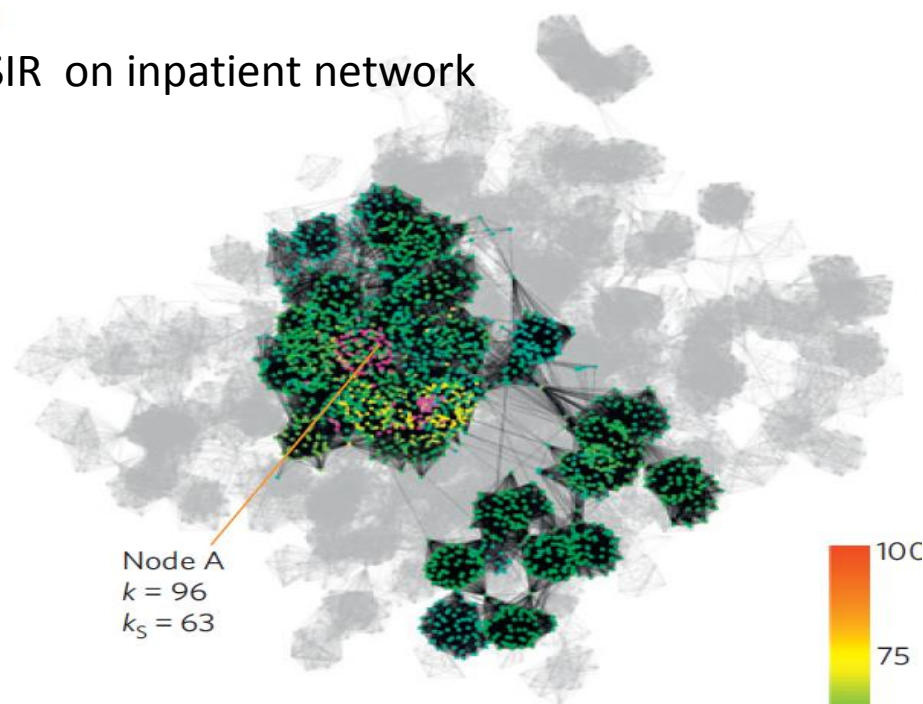

Identification of influential spreaders in complex networks

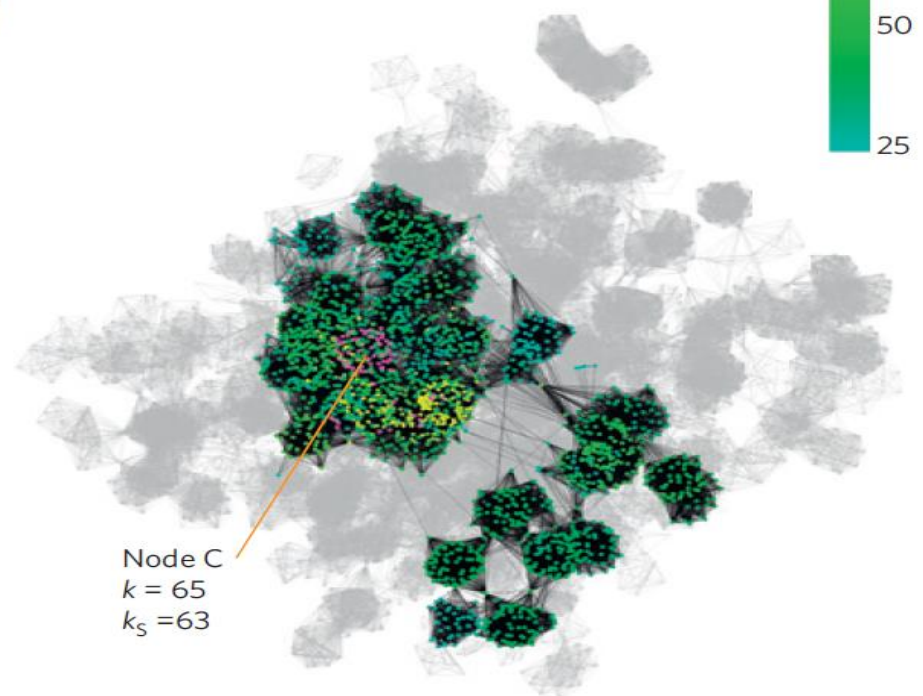

METHOD: k-shell decomposition analysis
Carmi et al: PNAS (2009)

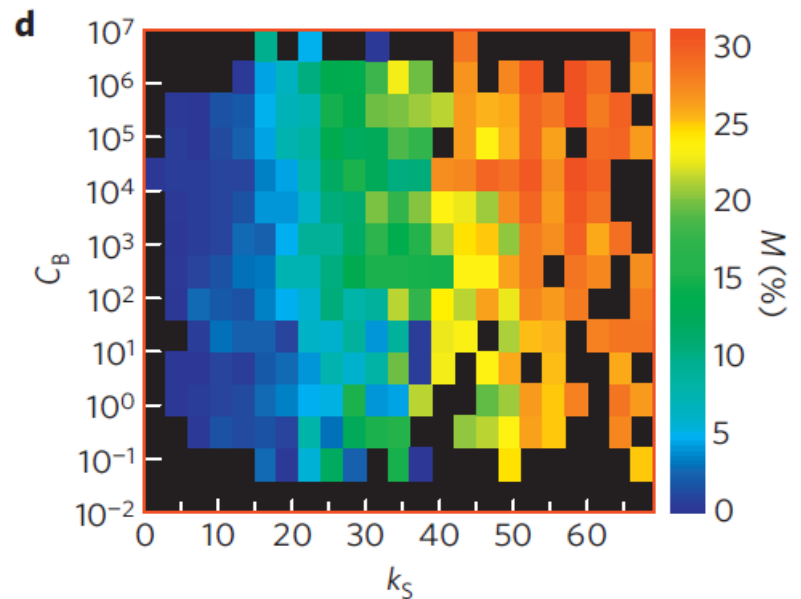

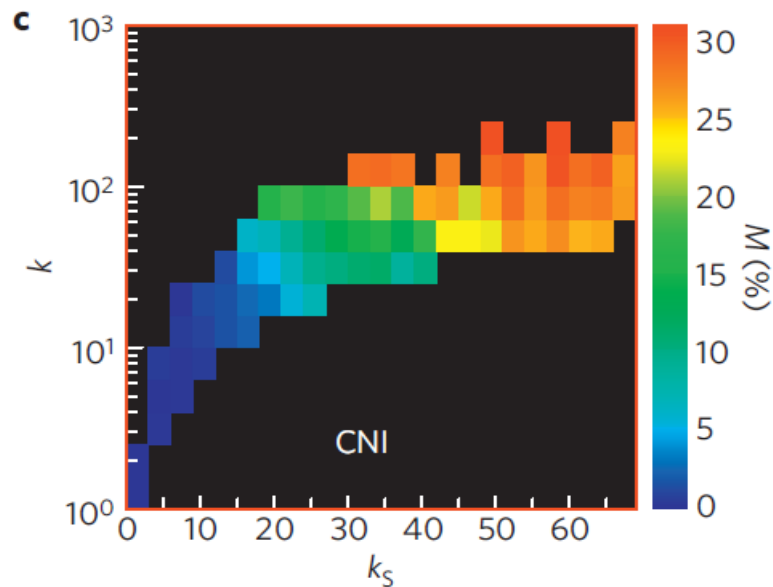

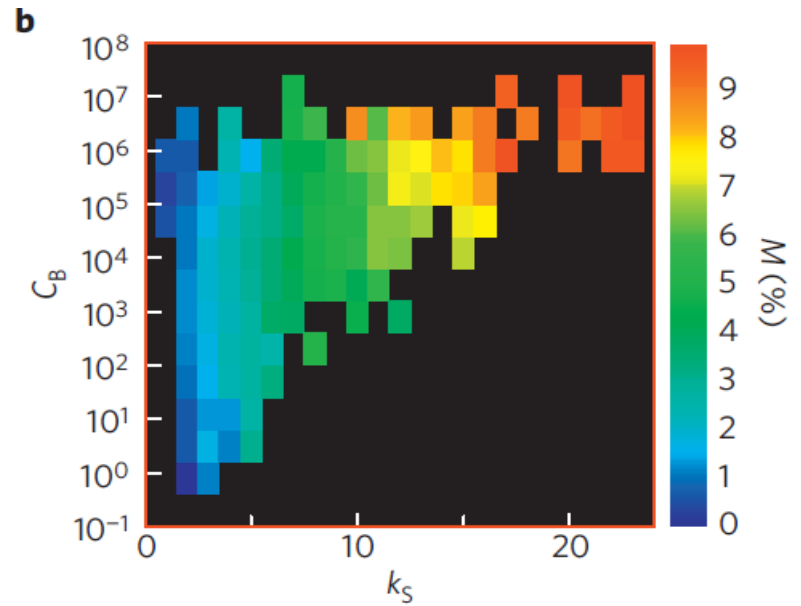

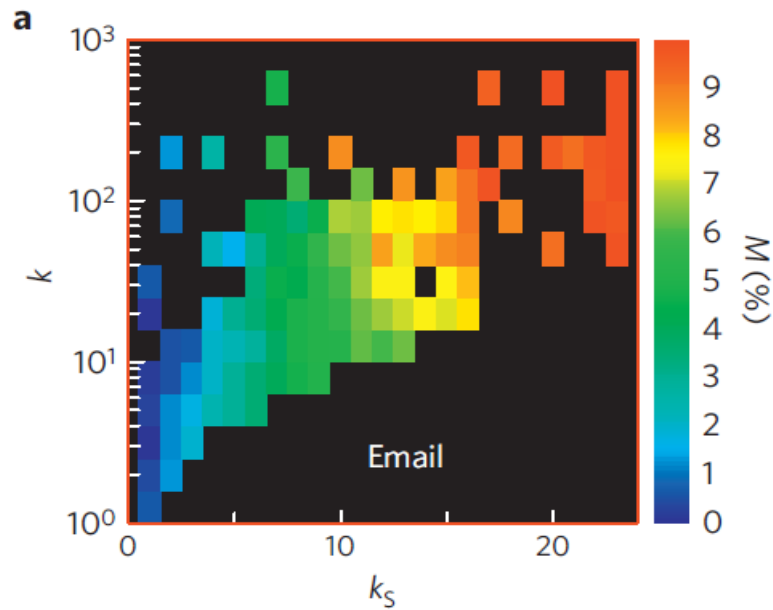

b
SIR on inpatient network

d

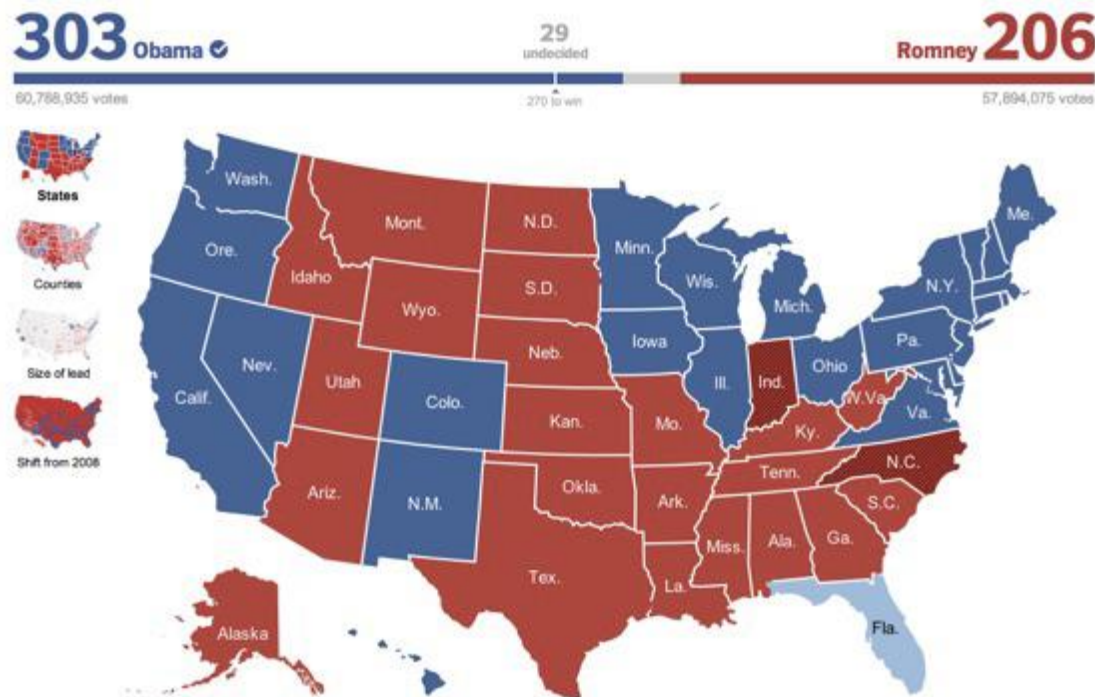

Test: SIR on real networks: email ($\beta=0.08$) and inpatient networks ($\beta=0.04$)

How opinions are formed?

Consensus Opinion Models

- Voter Model (Holley and Liggett 1975, Redner 2005): The agents imitate their neighbors
- Majority Rule Model (S. Galam et. al, 2002, P. L. Krapivsky et. Al 2003) : Agents follow the majority opinion of their friends

How opinions are formed?

Consensus Opinion Models

- Voter Model (Holley and Liggett 1975, Redner 2005): The agents imitate their neighbors
- Majority Rule Model (S. Galam et. al, 2002, P.L. Krapivsky et. Al 2003) : Agents follow the majority opinion of their friends

Non-Consensus Opinion (NCO) Models (J. Shao et.al, 2009):

- Agent's opinion is influenced by both its own current opinion and the opinions of his friends
- Agent follows the majority opinion of his local community, which include agent's friends and itself

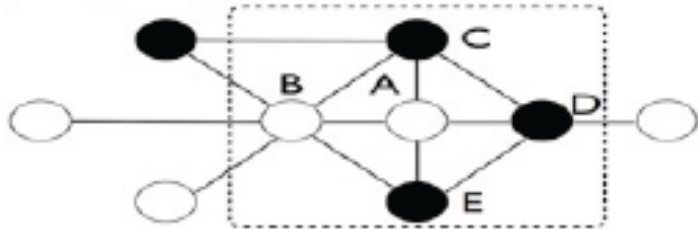

Similar model (independently) by **F. Schweitzer and L. Behera**, Eur. Phys. J. B 67, 301(2009)

Majority Model

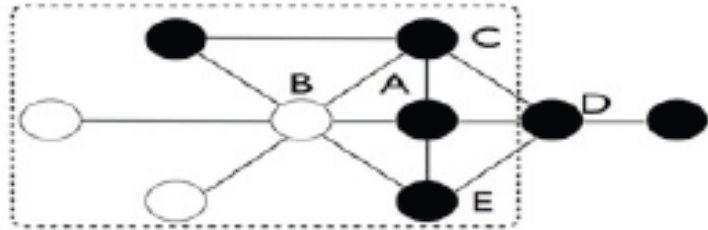

VS

NCO Model

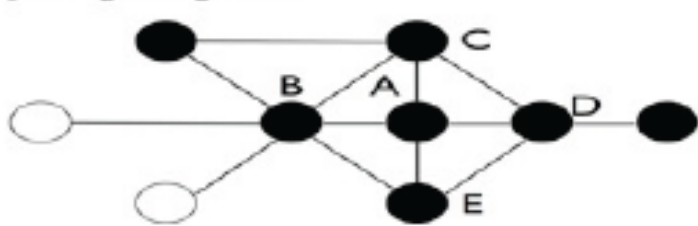

(a) Majority $t=0$

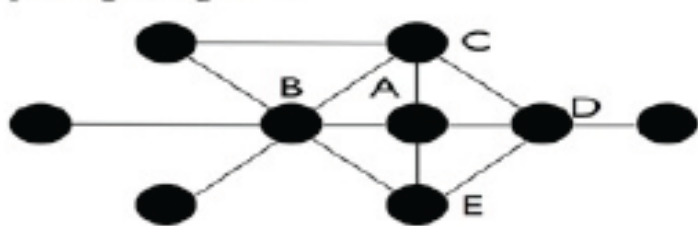

(b) Majority $t=1$

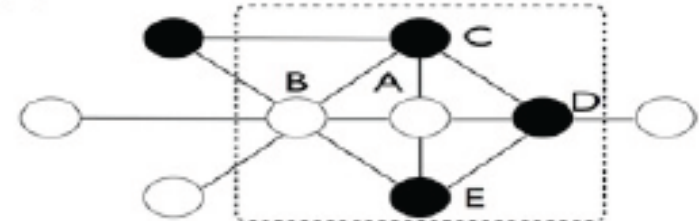

(c) Majority $t=2$

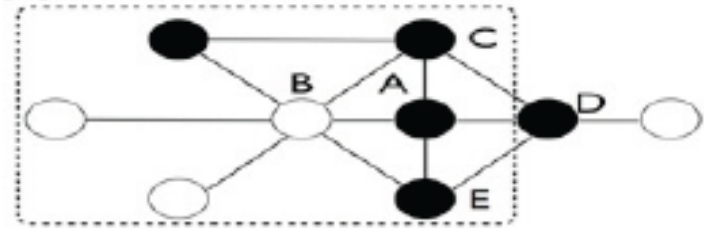

(d) Majority $t=3$

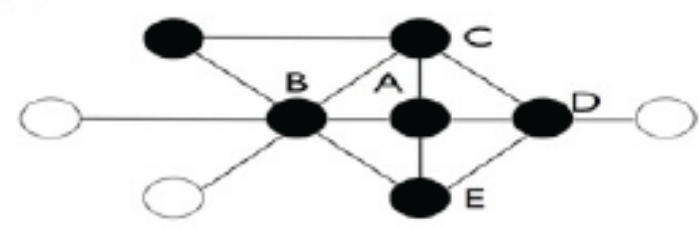

(a) NCO $t=0$

(b) NCO $t=1$

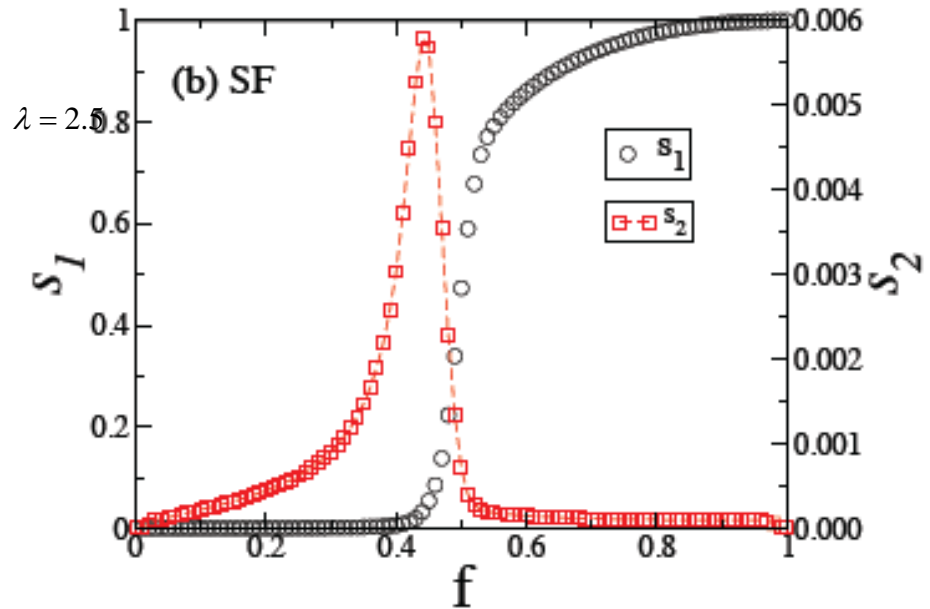

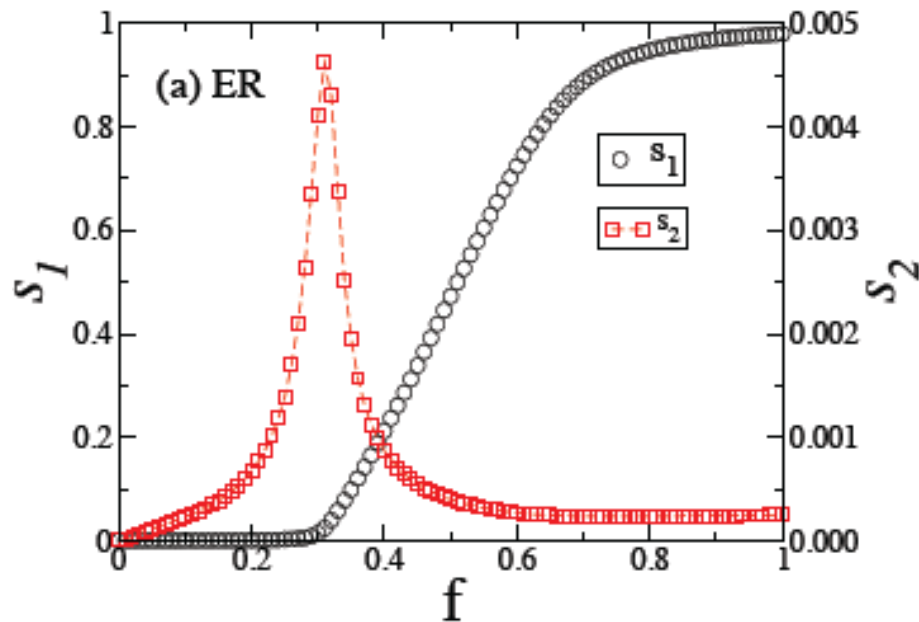

(c) NCO $t=2$

Considering the agent's own opinion leads to **non-consensus** state

NCO Model on Single Networks

f : Initial fraction of one of the opinions

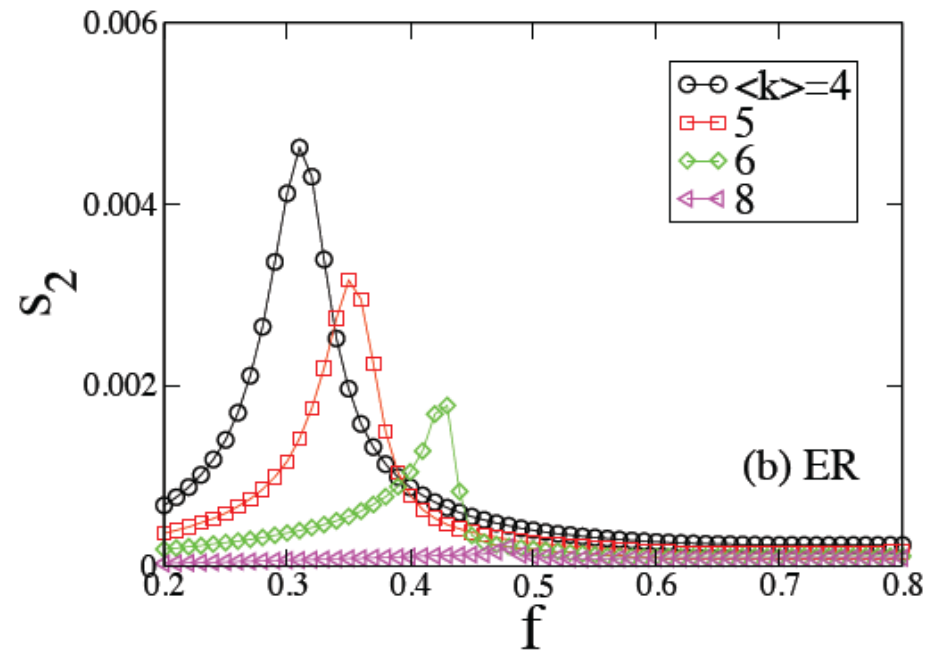

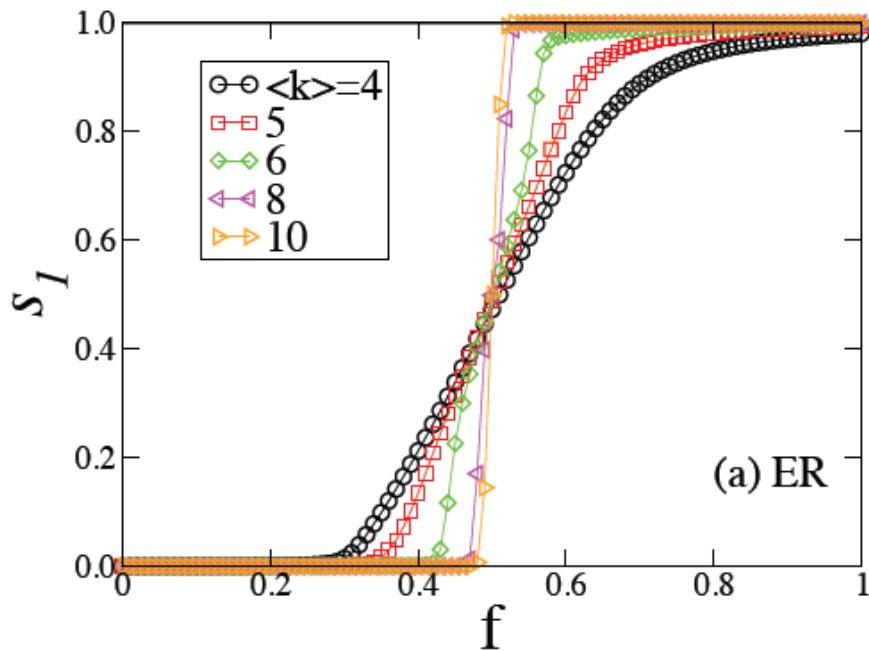

ER networks with
average degree=4

SF networks with

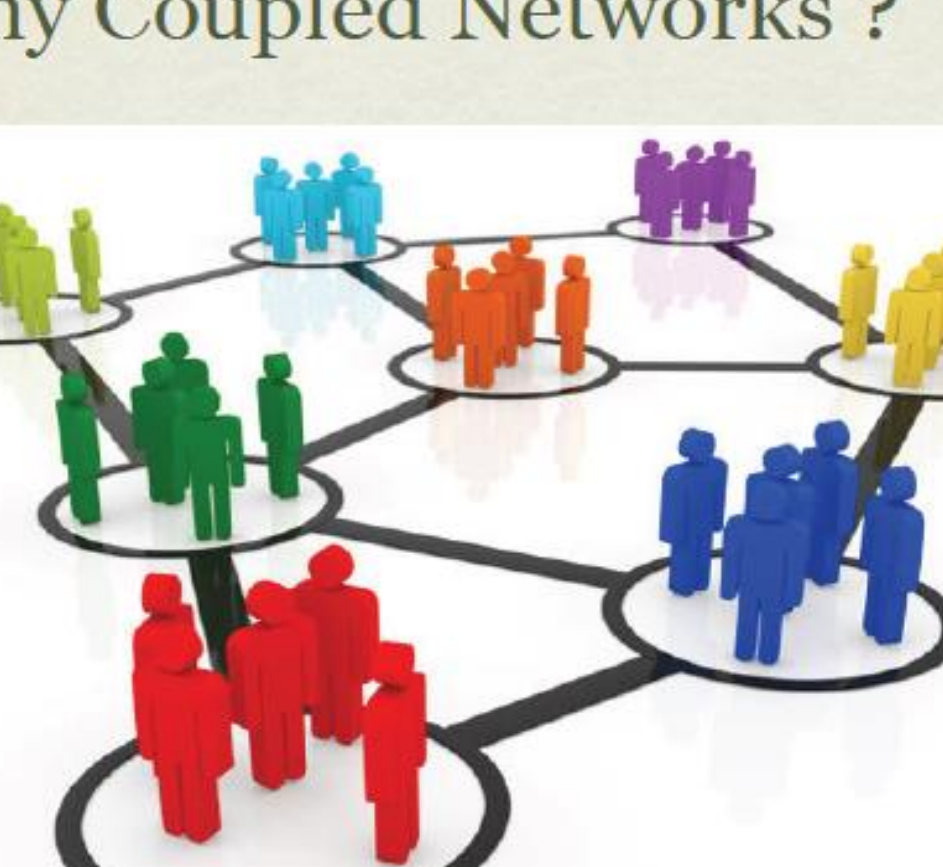

Consensus Opinion Models Non-Consensus Opinion Models

- Increase The Average Degree of the Networks

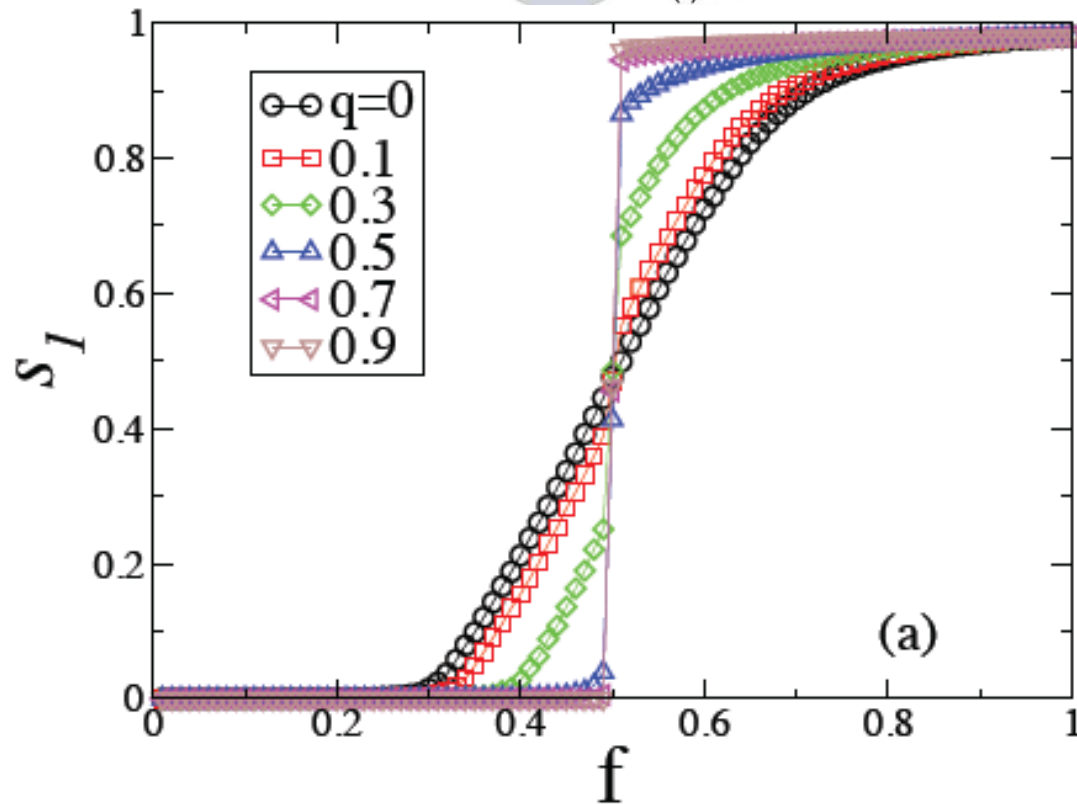

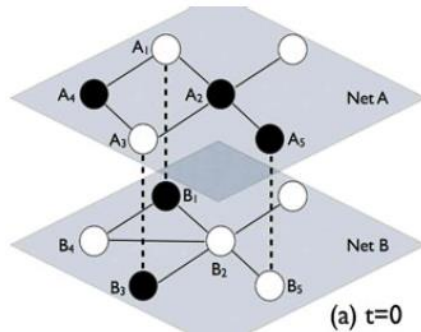

When the average degree of the networks increases, the importance of one's own opinion decreases and the NCO model converges to the Majority Rule model

Why Coupled Networks ?

Interdependent networks model: S. V. Buldyrev, R. Parshani, G. Paul, H. E. Stanley, and S. Havlin, Nature (2010)

NCO Model on Coupled Networks

Second Order
Transition (NCO on
Single Network)

Hybrid Transition
(Abrupt Transition
Dominate)

Similar to percolation in
interdependent networks
Buldyrev et al , Nature (2010)

FOUR QUESTION ON SOCIAL NETWORKS---PARTIAL ANSWERS

MAIN MESSAGES:

How social networks are created?

Gallos et al PRX (2012)

Motifs occur significantly in social interactions

How to identify influential spreaders?

Kitsak et al Nature Phys. (2010)

In many cases K-shell better than degree or betweenness

How opinions are formed?

Shao et al, PRL (2009)

Qian Li et al J. Stat. Phys (2013)

Agent's own opinion should be considered

How extreme opinions occur?

Makse et al preprint (2013)

Agents surrounding by less extreme people are more stubborn
